## Requirement of a wireframe in UI/UX design :

- Wireframes are essential blueprints in UI/UX design, offering a structural outline of digital interfaces like websites or apps. They map out the layout, prioritize elements through visual hierarchy, and demonstrate user interaction and flow. By keeping things simple and clear, wireframes enable iterative design, allowing for easy modifications and improvements. Crucially, they serve as effective communication tools, facilitating collaboration among designers, developers, and clients to ensure alignment and enhance the user experience.

## wireframe for a HOME Page :
